(57) Abstract :

The present invention relates to a media developed by using a balanced combination of Soya and Corn for fungal sub culturing without using any major processing and refining steps. The soya bean and corn grain-based media is processed with minimal steps to avoid any kind of nutrient loss. The minimally processed media obtained in the form of a fine powder is suspended in a buffer to obtain a fine suspension media. The media enhances the growth and sporulation rate of fungus by 3-5 times and reduction in duration of incubation by half, compared to any market available commercial culture media formulations.
